Abstract (Basic): DE 2165399 A

Laminated film with a gas permeability measured at 30 degrees C of ≤ 50 ml./m².24 hr.atm., consists of (I) a biaxially drawn support film of a polyamide contg. ≥ 70 mole-% units of m-xylylenediamine, opt. together with ≤ 30 mole-% p-xylylenediamine, and a 6-10 C alpha, omega - dicarboxylic acid, and (II) ≥ 1 layer of a thermoplastic resin having m.pt. at least 50 degrees C lower than that of the film (I). Film (I) has the following physical properties (1) a gas permeability constant measured at 30 degrees C of $\leq 9 \times 10^{-13}$ ml.cm/cm².sec.cmHg., (2) a planar orientation index $x + y / z - z$ of ≥ 0.025 (where x = the refractive index in the lengthwise direction of the film; y = the refractive index in the transverse direction of the film; and z = the refractive index in the thickness direction of the film), (3) a refraction residual value x-y of ≤ 0.045 , (4) a tensile strength of ≥ 10 kg./mm² in the lengthwise and transverse directions, (5) an elongation at break in the lengthwise and transverse directions of 30-150%, (6) a draw limit of ≥ 5 kg./mm² in the lengthwise and transverse directions, and (7) an elongation at the draw limit of 2-6% in the lengthwise and transverse directions.
